 12. Summary
-

1. Purpose and Scope

NovaTech Solutions delivers all core products — CRM, Projects, Connect, Insights, and Helpdesk — as cloud-based software accessed entirely online. There is no physical product shipment associated with a standard subscription order. This policy describes how an order is processed from purchase through active access ("provisioning"), how customers can track order status, and how NovaTech handles delays, failures, international accounts, and cancellations within that digital delivery model. A short section is also included covering the limited physical materials NovaTech does occasionally distribute, such as onboarding welcome kits for qualifying Enterprise contracts.

2. Order Lifecycle

Every order — whether a new subscription, a seat addition, an edition upgrade, or an add-on purchase — passes through the following stages:

1. **Order Placement** — Completed self-service through the in-app Upgrade flow, or through a signed Order Form for Enterprise purchases.
2. **Payment Confirmation** — Payment is authorized and confirmed through the selected payment method.

3. **Provisioning** — NovaTech's systems automatically create or update the relevant product access, seat allocation, and edition-level feature flags on the account.
4. **Activation Notification** — The account administrator receives an email confirmation once provisioning is complete, along with a summary of what changed.
5. **Post-Activation Setup** — For new product additions, the relevant setup wizard becomes available to guide initial configuration (see Product User Manual, Document 5, Section 3).

For self-service orders (Starter and Professional editions, and most seat/add-on changes on any edition), stages 1 through 4 are fully automated and typically complete within minutes. Enterprise orders involving custom contract terms follow the extended process described in the Pricing and Subscription Guide (Document 2), Section 5.1, which includes legal review and a formal implementation kickoff prior to full provisioning.

3. Provisioning Methods and Delivery Timelines

Order Type	Provisioning Method	Typical Timeline
New Starter or Professional subscription (self-service)	Automated, immediate	Under 5 minutes
Seat addition to existing subscription	Automated, immediate	Under 5 minutes
Edition upgrade (Starter to Professional)	Automated, immediate	Under 5 minutes
Edition upgrade to Enterprise	Manual, coordinated with Account Executive	2–10 business days, per Section 5.1 of the Pricing Guide
New Enterprise subscription (full onboarding)	Manual, coordinated implementation	10 business days from signature to full kickoff
Custom domain configuration	Automated with DNS verification	Up to 24 hours after DNS records are correctly configured by the customer
SSO/SCIM configuration (Professional/Enterprise)	Guided self-service or Implementation-assisted	1–5 business days depending on identity provider complexity
On-premises Enterprise deployment	Manual, per Enterprise Infrastructure Agreement	Scoped individually; typically 4–8 weeks

Note: "Provisioning" refers strictly to the technical activation of access and features. It does not include the time a customer's own team may need to complete data migration, integration configuration, or end-user training, all of which follow provisioning and are covered in the Product User Manual (Document 5).

4. Order Status Tracking

Self-service orders display real-time status under Admin Console > Billing > Order History, showing each order as Pending, Processing, or Complete. Because most self-service provisioning completes within minutes, the "Processing" state is rarely visible for more than a few seconds under normal conditions.

Enterprise orders are tracked through a dedicated Implementation Tracker shared with the customer's assigned Customer Success Manager, showing milestone completion across contract execution, technical provisioning, data migration (if applicable), and go-live readiness. Customers can request a status update at any time by contacting their Customer Success Manager directly or emailing implementation@novatechsolutions.com.

5. Provisioning Delays

While the large majority of orders provision automatically without incident, delays can occur under the following circumstances:

Cause	Typical Impact	Resolution Path
Payment method requires additional bank verification	Provisioning paused until payment clears	Customer completes verification prompted by payment processor; provisioning resumes automatically
Custom domain DNS records misconfigured	Custom domain not resolving	Customer corrects DNS records per setup guide; automated retry occurs every 15 minutes for 24 hours
Enterprise legal review in progress	Full account activation delayed	Standard part of Enterprise process; timeline communicated by Account Executive
High-volume signup period (rare)	Self-service provisioning may take up to 30 minutes instead of the typical under-5-minute window	Automated system catches up without customer action required
SCIM provisioning misconfiguration on customer's identity provider	New users not syncing as expected	Reviewed jointly with customer IT team using SSO Logs (Admin Console > Security)

Customers whose self-service order has not completed provisioning within 60 minutes should contact Support, referencing the order confirmation number, so the order can be manually reviewed.

6. Failed or Incomplete Provisioning

In rare cases, an order may fail to provision correctly — for example, a seat addition that is paid for but not reflected in the Admin Console. When this occurs:

1. The customer (or NovaTech's automated monitoring) identifies the discrepancy between the paid order and actual account configuration.
2. Support verifies the payment record and order details.
3. Support manually completes provisioning to match the paid order, typically within one business day.
4. No additional charge is applied for the manual correction, and the customer is notified once resolved.

Warning: If a payment was charged but no corresponding order can be located in NovaTech's systems, this should be reported immediately to Billing Support as a possible billing error, which is handled under the duplicate/erroneous charge provisions in the Pricing and Subscription Guide, Section 13.

7. International Accounts and Data Residency

NovaTech Solutions serves customers globally, with regional operations supporting the Americas, Europe, and Asia-Pacific. Because there is no physical shipment involved, "international delivery" in NovaTech's context refers to two things: billing localization and data residency.

Billing localization: Customers are billed in their local currency where supported (USD, EUR, GBP, AUD, CAD, BRL, JPY, INR), with applicable regional tax handling as described in the Pricing and Subscription Guide, Section 9.

Data residency: The physical region in which an organization's data is stored is selected during account setup and depends on subscription edition:

Edition	Available Data Residency Options
Starter	United States only
Professional	United States or European Union
Enterprise	United States, European Union, Asia-Pacific, or custom arrangement

Data residency selection is generally fixed at account creation. Customers who need to change their data residency region after account creation should contact their Customer Success Manager (Enterprise) or Support (Professional), as this requires a coordinated data migration between regional data centers rather than a simple configuration change, and is scoped individually based on data volume.

8. Billing and Account Address Changes

Because NovaTech does not ship physical goods for standard subscriptions, "address" in this context refers to the billing address associated with the account, which determines applicable tax treatment and default currency.

Billing address changes can be made at any time from Admin Console > Billing > Billing Contact, and take effect on the next generated invoice; they do not retroactively adjust taxes on invoices already issued. Customers relocating to a different country or tax jurisdiction should update their billing address promptly to ensure correct tax calculation going forward, and may need to provide updated tax registration information (such as a new VAT number) if applicable.

9. Order Cancellation

Orders can be canceled at different points in the lifecycle with different implications:

- **Before provisioning completes:** Self-service orders can rarely be canceled mid-provisioning given the typical sub-5-minute completion window; in the unlikely event this is needed, contact Support immediately.
 - **After provisioning, within 14 days (first-time purchase):** Eligible for full refund and deprovisioning per the Refund Conditions in the Pricing and Subscription Guide, Section 13.
 - **After provisioning, standard subscription changes:** Governed by the standard Cancellation Policy in the Pricing and Subscription Guide, Section 12, including the distinction between monthly and annual terms.
 - **Enterprise orders under a signed Order Form:** Governed by termination clauses in the applicable Master Services Agreement.
-

10. Physical Materials and Merchandise

While NovaTech's products themselves are delivered entirely digitally, NovaTech does occasionally distribute limited physical materials:

- **Enterprise Welcome Kits** — Sent to the primary point of contact for new Enterprise contracts exceeding 500 seats, typically containing printed onboarding materials and branded items. Delivery is handled by a third-party fulfillment partner and typically arrives within 10–15 business days of contract execution.
- **Conference and Event Materials** — Distributed at NovaTech-hosted or sponsored events, not tied to a specific customer order.
- **Hardware Security Keys** — For Enterprise customers implementing FIDO2/WebAuthn hardware-based MFA at scale, NovaTech can facilitate bulk purchase and shipment through a certified hardware partner; this is a pass-through arrangement and shipment timelines are governed by the hardware partner's own logistics, typically 2–4 weeks for bulk orders.

These physical materials are not required for product functionality and are provided as a courtesy or accommodation rather than as part of the core subscription deliverable.

11. Frequently Encountered Scenarios

The following scenarios represent the most common order- and provisioning-related situations reported to Order Operations:

A customer completes a self-service Professional upgrade but does not see new features appear immediately. In nearly all cases this resolves within minutes as provisioning

completes; a browser refresh or brief re-login typically reflects the updated access, since some feature flags are cached at the session level.

An Enterprise customer's legal team requests changes to the Order Form after an initial quote has been issued. This restarts the commercial negotiation and legal review stages of the order lifecycle described in Section 2, and does not affect any already-active products the customer may be using under a prior agreement.

A customer changes their organization's billing country mid-subscription due to a company relocation. The billing address update in Section 8 handles tax and currency going forward; if the customer also needs their data residency changed (Section 7), this is treated as a separate, individually scoped request.

A customer reports that a Welcome Kit never arrived. Order Operations confirms shipment with the fulfillment partner and, since these are courtesy materials rather than part of the core deliverable, typically arranges a reshipment rather than treating it as a service failure under the Warranty and Service Policy.

12. Summary

As a cloud-delivered SaaS provider, NovaTech Solutions' order lifecycle centers on automated digital provisioning rather than physical shipment for the overwhelming majority of orders, with self-service changes typically completing in minutes and Enterprise onboarding following a structured, individually tracked implementation process. Delays and provisioning failures are rare and are resolved through Support or the customer's Implementation Tracker. International customers are supported through localized billing and configurable data residency rather than physical delivery logistics. A small set of physical materials, such as Enterprise Welcome Kits and bulk hardware security keys, are handled separately through third-party fulfillment. This policy should be read alongside the Pricing and Subscription Guide (Document 2) for billing-specific terms and the Product User Manual (Document 5) for post-provisioning setup guidance.
