 5. Multi-Factor Authentication (MFA)
 6. Profile Management
 7. Email Address Changes
 8. Phone Verification
 9. Organization Accounts
 10. User Invitations and Offboarding
 11. Account Deletion
 12. Security Recommendations
 13. Summary
-

1. Purpose and Scope

This guide covers the full lifecycle of managing a NovaTech Solutions user account and, where applicable, an organization account — from initial registration through eventual account closure. It applies to individual account holders as well as administrators managing accounts on behalf of a broader organization. Security-specific technical detail beyond account management (encryption standards, data handling, compliance certifications) is covered separately in the Privacy and Security Policy (Document 10).

2. Registration

New accounts can be created in one of three ways:

1. **Self-service signup** at novatechsolutions.com/signup, requiring a valid email address, a password meeting NovaTech's complexity requirements, and organization name.
2. **Free trial signup**, which automatically creates an account scoped to the trial's selected product and provisions Professional-level feature access for 14 days.
3. **Invitation-based signup**, where a user is invited by an existing organization administrator and completes registration by accepting the emailed invitation link and

setting a password.

Each email address may be associated with only one NovaTech account. Attempting to register with an email address already on file will prompt the user to log in or initiate a password reset instead. Registration requires acceptance of NovaTech's Terms of Service and, where applicable, review of the Privacy and Security Policy.

Note: Organization name provided at registration can be changed later at any time and does not need to exactly match a legal entity name.

3. Login Methods

NovaTech supports several authentication methods, which can be used individually or in combination depending on edition:

Method	Availability
Email and password	All editions
Sign in with Google	All editions, individual accounts
Sign in with Microsoft	All editions, individual accounts
SAML-based Single Sign-On (SSO)	Professional and Enterprise
SSO with SCIM automatic user provisioning	Enterprise only

Organizations using SSO can choose to allow email/password as a fallback login method or disable it entirely, requiring all users to authenticate exclusively through the configured identity provider. This setting is managed under Admin Console > Security > SSO Configuration.

4. Password Reset

Users who forget their password select "Forgot Password" from the login screen and enter their registered email address. A reset link is sent immediately and remains valid for 60 minutes. Passwords must meet the following requirements:

- Minimum 10 characters
- At least one uppercase letter
- At least one lowercase letter
- At least one number
- At least one special character

Password history is retained to prevent immediate reuse of the previous 5 passwords. Administrators can force a password reset for any individual user from Admin Console > Users > [user] > Force Password Reset, which invalidates the user's current session and requires them to set a new password at next login.

Tip: Users on an SSO-enabled account whose password appears not to work should first confirm whether their organization has disabled email/password login entirely, in which case password reset is not applicable and login must occur through the organization's identity provider.

5. Multi-Factor Authentication (MFA)

MFA adds a second verification step beyond password entry. NovaTech supports:

- **Authenticator app (TOTP)** — compatible with any standard authenticator app; available on all editions.
- **SMS-based verification** — available on Professional and Enterprise editions.
- **Hardware security key (FIDO2/WebAuthn)** — available on Professional and Enterprise editions, recommended for administrator accounts and any account with elevated data access.

Enrolling in MFA:

1. Navigate to Settings > Security > Multi-Factor Authentication.
2. Select the desired method and follow the on-screen enrollment steps.
3. Save the provided backup codes in a secure location; these allow account access if the primary MFA method becomes unavailable.

Administrators can enforce mandatory MFA for all users in an organization from Admin Console > Security > MFA Policy, available on Professional and Enterprise editions. Enterprise administrators can additionally restrict which MFA methods are permitted (for example, requiring hardware keys and disallowing SMS for higher-security environments).

Users who lose access to their MFA device and did not save backup codes should contact their organization administrator for a manual MFA reset, or contact NovaTech Support directly if no administrator is available, which requires completing identity verification.

6. Profile Management

Each user manages their own profile under Settings > Profile, including:

- Display name and profile photo
- Time zone and locale (affects displayed dates, times, and default language)
- Job title and department (used for reporting and territory assignment in CRM)
- Theme preference (light or dark mode)

- Personal notification preferences (see Product User Manual, Document 5, Section 7)

Administrators can view but not directly edit certain profile fields for other users; instead, administrators can request the user update their own profile, or, for organization-critical fields like department assignment used in territory rules, make changes through the Admin Console's user management interface with the change logged in the Audit Log.

7. Email Address Changes

A user's email address serves as their unique login identifier and can be changed as follows:

1. Navigate to Settings > Profile > Email Address.
2. Enter the new email address.
3. A verification link is sent to the new address; the change does not take effect until the link is clicked.
4. Once verified, the new email address becomes the login identifier; the previous email address is released and can be used to register a new, separate account if desired.

Warning: If a user's email is changed to an address that is later compromised, the compromised address controls access to the NovaTech account until the change is reversed or the account is otherwise secured. Users should ensure their email account itself is protected with strong authentication before updating their NovaTech login email.

Administrators can also initiate an email change on behalf of a user experiencing access issues, from Admin Console > Users > [user] > Update Email, which similarly requires verification at the new address before taking effect.

8. Phone Verification

Phone numbers are used for two purposes on a NovaTech account: SMS-based MFA (where enabled) and, optionally, account recovery contact information. Phone verification is completed by entering a number under Settings > Security > Phone Number, after which a one-time code is sent via SMS to confirm ownership before the number is activated for any security purpose.

Phone numbers used for account recovery are not visible to other users within the organization and are used solely for NovaTech-initiated verification communications. Removing a verified phone number that is the sole configured MFA method will prompt the user to enroll an alternative MFA method before the removal is finalized, to avoid an unintended logout.

9. Organization Accounts

An organization account groups multiple individual users under a shared billing relationship, shared branding, and (where applicable) shared NovaTech Identity single sign-on. Organization-level settings, managed by administrators, include:

- Organization name, logo, and custom domain
- Default data residency region (set at creation; see Order Provisioning and Delivery Policy, Document 7, Section 7)
- Security policies (MFA enforcement, session timeout, IP allowlisting)
- Billing contact and payment methods

Large organizations with multiple business units or subsidiaries may request a **Multi-Org Hierarchy** configuration (Enterprise only), which allows separate operational sub-accounts — each with independent user bases and configuration — to roll up under a single consolidated billing relationship. This is configured jointly with a NovaTech Implementation specialist and is not available as a self-service setting.

10. User Invitations and Offboarding

Inviting a new user:

1. Navigate to Admin Console > Users > Invite User.
2. Enter the invitee's email address and select which products and roles to assign.
3. An invitation email is sent, valid for 7 days.
4. The invitee completes registration by setting a password (or authenticating via the organization's SSO provider, if configured) and immediately gains the assigned access.

Invitations that expire unused can be resent from Admin Console > Users > Pending Invitations without needing to re-enter the invitee's information.

Offboarding a user:

1. Navigate to Admin Console > Users > [user] > Deactivate.
2. Select a fallback owner to whom the departing user's records (deals, tasks, tickets, files) will be reassigned.
3. Confirm deactivation; the user immediately loses login access, and their license becomes available for reassignment to another employee.

Note: Deactivating a user does not delete their historical activity or authored records; it removes their login access and reassigns ownership of active records per the administrator's selection during the offboarding step.

Administrators are encouraged to complete offboarding promptly when an employee departs, both to prevent unauthorized access and to free the license for reassignment without an unnecessary additional seat purchase.

11. Account Deletion

Account deletion is distinct from subscription cancellation. Cancellation ends billing and access to paid features (see Pricing and Subscription Guide, Section 12); deletion permanently removes the account and its data entirely.

Deleting an individual user account (for account holders without an organization, or organization owners closing the full account):

1. Navigate to Settings > Account > Close Account, or contact Billing Support.
2. Confirm understanding that this action is permanent following the retention window described below.
3. The account enters a 30-day pending deletion state, during which data remains recoverable upon request.
4. After 30 days, all associated data is permanently deleted from production systems, with residual copies purged from backup systems within the subsequent 35-day backup retention cycle described in the Warranty and Service Policy (Document 6).

Deleting a full organization account follows the same overall structure but must be initiated by the organization owner or a designated administrator, and affects all users under that organization simultaneously. Organization deletion requests for accounts with an active paid subscription first require the subscription to be canceled per standard cancellation procedures.

Warning: Account deletion is irreversible after the 30-day pending window closes. Customers considering deletion who may want to return in the future should evaluate whether a simple cancellation (which preserves data for reactivation) better suits their needs.

12. Security Recommendations

NovaTech recommends the following practices for all account holders and administrators:

- Enroll in multi-factor authentication even where not organizationally mandated, particularly for any account with administrator privileges.
- Use a unique, complex password for the NovaTech account rather than reusing a password from another service.
- Store MFA backup codes in a secure location separate from the primary device used for daily MFA verification.

- Review the Audit Log periodically (Admin Console > Security > Audit Log) for unfamiliar login activity or configuration changes.
 - Promptly offboard departing employees rather than allowing dormant accounts with active access to persist.
 - For organizations handling sensitive data, enable IP allowlisting and consider requiring hardware security keys over SMS-based MFA, given the greater phishing resistance of hardware-based methods.
 - Designate at least two active administrators to avoid a single point of failure in account governance.
-

13. Summary

This guide covers the complete lifecycle of individual and organization account management on the NovaTech platform: registration, login methods, password and MFA management, profile and contact information updates, organization-level configuration, user invitation and offboarding, and account deletion. Administrators play a central role in maintaining account security and proper access governance, particularly around timely offboarding and MFA enforcement. This guide should be read alongside the Privacy and Security Policy (Document 10) for deeper technical detail on data handling and security architecture, and the Product User Manual (Document 5) for broader platform administration guidance.
